BRIEFLY

Full-stack web developer with over 3.5 years of commercial experience.
Author of libraries with a combined total of over 10,000 weekly downloads.
I am currently considering all opportunities, including those outside my primary field. I am open to new challenges.
Please contact me via Telegram or email if you have any questions.

STACK

Frontend (libs) - Next_React(ISR/SSR/CSR/SSG)

Languages: TypeScript, JavaScript, Dart, jQuery
SM: Redux, MobX, Context
Rest API: RTK Query, Fetch API, Axios, AJAX, REST API
Tooling & Configuration: ESLint, Prettier, npm scripts, package.json, tsconfig, environment variables, path aliases, module resolution
Package Development: npm packages, package publishing, semantic versioning, package exports, TypeScript declarations
HTML/CSS: HTML5, CSS3, SCSS, Tailwind CSS, CSS Modules, CSS-in-JS, JSX, SVG
UI Comp libs: Hero UI, Ant
Anim libs: Motion / Framer Motion
3D: Three.js, WebGL
SEO: Dynamic build from data (schema, robots, sitemap)

Backend - NestJS/PHP(clear/DTO)

Languages: TypeScript, JavaScript
Documentation: Technical Documentation, API Documentation, Swagger/OpenAPI, README, npm Package Documentation
DB: Postgress, MySQL, Redis, Json

Deploy - Git/CI/CD

Version Control & Collaboration: Git, GitHub, Push/Pull, Pull Requests, Branching
CI/CD: GitHub Actions, automated build & deployment pipelines
Package Management: npm, package.json, npm package publishing, versioning, package maintenance
Infrastructure & Deployment: VPS, Linux, Nginx, PM2, Docker, SSL, DNS, Vercel, production deployment

LLM

Implementation and configuration of AI agents. Various approaches: content scanners with custom-tailored data selection configurations; processing of specific data.

CASE STUDIES

Utility-lab.store - solo project
Free-share resource for development

A resource featuring UI components for React/Next.
Includes a wide range of generators for patterns, backgrounds, gradients, box-shadows, and more.
Offers an extensive knowledge base on CSS selectors and utilities, complete with code examples and implementation details.
The project is currently in an active phase of development.
Features dynamic, timely data updates—including version control and accessibility-related change tracking across various browsers—powered by a manager that processes, compares, and reduces data from public APIs.

Dva Petra Winery
Winery website and CRM dashboard development

SSR/ISR hybrid SEO-optimized winery website built with Next.js and PHP:

- GEO manager for managing sales branches, purchasing, availability, analytics, statistics, and integration. Address, product, event, and tour filtering systems. Editing 90% of website content using the dashboard.
- Adaptation for devices/resolutions

SPA dashboard with custom authentication and a user account area:

- Authorization, role management, and permissions management; impact on capabilities for interacting with data and other users based on roles and permissions.
- Tools for managing content, events, locations, and products; editing the site's visual design and content; managing reviews and notifications; publishing update release notes; and much more.
- Server-side tracking of unique visits, repeat visits, and site return consistency, presented in charts.

- I implemented a geo-presence pattern. Any destination can be linked to an object state manager based on user geolocation, the establishment's operating hours, the event status, and so on. I utilized the FIAS database—stripped of unnecessary data—as a lightweight table containing only the fields required for the geo-manager to function reliably.
- The interactive patch notes pattern with the following changes:
  1) inline-text format.
  2) Minimalist admin editor.
- To give a simple example: a unique shopping cart (featuring swap/compare functions, shipping cost calculation, pricing for loyalty card holders, etc.). This feature is fully implemented—including the card integration, calculators, and an order management system that tracks the history of each order. (It turns out there's a lot to write about this—thanks for reading this far! It was worth writing it all down.) The entire purchasing module is currently on hold, however, because—due to legal regulations—the client cannot currently sell alcohol remotely. But otherwise, it's just a single button on the dashboard, and all that complex functionality is fully operational.

Full-stack development: dashboard + website (seafood, fresh fish)
Development of an online store for fish products (SEO-friendly, responsive solution)

Development of an online store for fish products
Dashboard development

Full-stack development: dashboard + website (online store for smoking accessories)
PHP, JS, CSS, Full clear native solo project

Development of an online store for smoking devices and accessories using pure, native JS, HTML, and CSS, with a PHP backend.
Development of a dashboard for managing incoming data, product listings, and filter creation; data export; third-party API integration; and a unique review system that does not require user login. This system relies on browser fingerprinting and includes a management module to filter suspicious patterns and flag them for moderation (handling bots, email, and a live stream within the panel).
Backend technologies: PHP, SQL.

LANGUAGES

English: A1 (actively studying) **Ukraine:** native
